ByteWise Announces New Low-Cost Extrusion Profilometer

ByteWise Measurement Systems announces a new, lower-cost addition to their off-line extrusion Profilometer product family - the ProfilometerSL. The system uses ByteWise sheet-of-light ("SL") laser scanning sensors to digitize the top and bottom of an extrusion profile. Once digitized, the data is displayed in the same ProfileViewer Software used by the ByteWise Off-Line Profilometer which is currently used by 10 of the top 12 tire makers and is in use in over 100 tire plants worldwide.

ProfilometerSL is available in width sizes of 300mm and 450mm. The technology employs no moving parts, so it is extremely reliable in the production environment. Data acquisition time is instantaneous, so the measurement results are immediate.

The product is targeted toward tire makers who want faster, lower-cost, and more reliable profile measurements to support die management and quality management programs in their extrusion operations.

For additional information please contact Dennis Reynolds, Vice President Sales and Marketing, at 330-633-2253, dreynolds@bytewise.com, or check the ByteWise website at www.bytewise.com.
